Recall this when buying fertilizer

By ROY POWELL
County Agent

DAIRY PROFITS
Profits in dairy farming depend to a great extent upon careful selection of feeds and upon providing the cow with suitable rations for milk production.

Feed costs are generally considered to be one-half of the total cost of producing milk. Therefore, it is important to have well in mind the nutritive requirements of the dairy cow and how the various feeds and combination feeds will meet those needs most efficiently and economically.

The amount of feed a cow should receive depends on several factors, such as size of the cow, the amount of milk the cow is producing, the quality or fat percentage of the milk, and the condition of the cow.

CONFUSING RATIOS
12-12-0, 3-3-6, 4-12-12, 6-12-12, 6-12-4, 5-10-15. Are these figures confusing? They are. They are confusing because they represent different ratios, and the variety of fertilizers on the market with different ratios can be confusing. But basically, this is a very simple matter.

When buying fertilizer, farmers should remember that only three basic fertilizer ratios are needed to correct any soil fertility condition in Georgia.

The first of these ratios is of a fertilizer with an equal amount of phosphate and potash. Such a fertilizer would have a 4-12-12 or 6-12-12 ratio.

The second basic ratio is of a fertilizer with high phosphate and low potash content such as 6-12-6. The third basic ratio

would be of a fertilizer with low phosphate and high potash such as 5-10-15.

In any case, the first figure in the ratio represents nitrogen, the second, phosphate, and the third, potash.

Choosing between the three basic ratios depends on the soil test. It tells which one to use. Using the wrong choice can cost money.

PLANTING TREE SEEDLINGS
If you're planting tree seedlings this winter, or early spring, remember to keep their roots moist from time of delivery until they are set out. Seedlings must have healthy root systems. If the roots become dried out, they may suffer damage which might not be overcome.

If seedlings are stored in a cool place and kept moist until delivery, they usually will stay in good condition for as long as two weeks. If seedlings must wait for longer periods before planting, they should be pre-soaked.

There may be as many as 2,000 seedlings in a bundle. For best survival these should be planted as soon as possible after they are received. After they are heeled-in, cover with a moist soil and then drench with water.

On planting day keep the roots covered in their container with a sippy mud or water. Never allow the roots to be exposed to the sun or wind even for a few minutes, for the small root endings quickly die when exposed.

The infestation in some parts of the state is worse than it has ever been before.

Lice hide in an animal's long winter coat of hair and are in its blood. This happens at a time of the year when the cow or calf needs all its reserve strength to help it through the cold winter months.

Lice infestation causes lower gains on fed cattle and loss of weight in the brood cow herd. The affects are lowered resistance to disease and other parasites, sometimes resulting in death.

First symptoms of lice are rubbing and scratching on trees, posts or wire. Closer examination may reveal dark spots around the eyes and nose. Severe infestation will cause the hair to slip off in large patches due to rubbing.

Lice may be controlled by using lindane, benzene hexachloride, DDT or rotenone. For beef cattle DDT may be dusted if the weather is too cold for spraying or dipping, but spraying or dipping is more effective.

ALFALFA LIMIT REQUIREMENTS

Alfalfa requires a lot of time and will not produce profitably on acid soil. Three tons of alfalfa hay, which is a good average yield, contains 88 pounds of calcium. This equals the amount of calcium contained in 215 pounds of high grade limestone.

Some symptoms of this condition as numerous dead twigs and leaves, leaf particles, yellow and ripple-shaped, and nutshucks remaining on trees may still be apparent.

Last fall before frost came there would have been other symptoms—dead wood in tree tops, defoliation, discoloration, mottling of leaves, young leaves that were too small, yellow and ripple-shaped, and many undersized pecans.

Zinc sulfate should be applied at the rate of 1/2 pound for each year of the tree's age or for each inch in the trunk diameter. If rosette is severe on older trees, apply 10 to 15 pounds of zinc sulfate per tree. Begin the following year with a maintenance rate of three to five pounds per tree.

It takes only a small bit of common sense to realize that low-producing, non-profitable dairy cows should be culled. But what about the daughters of these cows, should they be culled too?

Pecan trees need zinc sulfate now

By ROY POWELL, County Agent

Almost all pecan trees in Georgia need an application of zinc sulfate, and now is the time to make the application of this material.

If zinc sulfate is deficient in the soil, a condition called rosette develops on pecan trees. Some symptoms of this condition as numerous dead twigs and leaves, leaf particles, yellow and ripple-shaped, and nutshucks remaining on trees may still be apparent.

Last fall before frost came there would have been other symptoms—dead wood in tree tops, defoliation, discoloration, mottling of leaves, young leaves that were too small, yellow and ripple-shaped, and many undersized pecans.

Becky Brannen honored on sixteenth birthday

On Friday evening, February 10, the Forest Heights Country Club was incomparably lovely with all the romance of St. Valentine's Day expressed in the cupid's bow and arrows, the hearts and flowers which were entwined with every tender memory forming the setting for Becky Brannen's sixteenth birthday party, a formal dance.

Mr. and Mrs. W. W. Brannen invited Becky's relatives, school mates and friends to come and make merry as they honored her on this very special occasion.

The club was like one continuous valentine from the entry as the boys and girls walked through the mammoth red heart encircled with white ruffles on each side red hearts dangled from innumerable red satin streamers. Suspended from the center of the dance floor were myriads of red and white hearts. The drapery revealed cupid's bows and arrows.

The refreshment table across the back of the club room was in white cloth touching the floor. Centering the table was covered in white cloth touching the floor. Centering the table was a two-tiered pound cake embossed with red and white roses flanked by silver branched candelabra with tall candles. In an epergne in the center of each candelabrum were arrangements of beautiful Professor Sargeant camellias. Silver trays held a variety of colorful and tasty sandwiches cut in heart shapes, diamonds and even bun shapes. Turkey sandwiches, cream cheese, pineapple and cherry in many shapes were served.

The punch table with crystal punch bowls at each end and centered with a candelabra with red carnations arranged in the center.

Dance music was furnished by the Joe Walters Orchestra. The guests were met by Mr. and Mrs. Brannen. Mrs. Howard Brunson, Betty's aunt, registered her guests and gave out the dance cards.

Assisting in serving were Mrs. George Starling, Mrs. M. C. Jones, and Mrs. Jimmy Adams, aunts of the bride, all living in Savannah; and Mrs. W. S. Cunningham, Statesboro.

Three exhibition dances featuring husband, Mr. and Mrs. M. Turing, Becky's great-aunt and C. Jones, were especially enjoyed. They studied five years with Arthur Murray.

Betty wore a floor length formal of pure silk and taffeta with a deep V-neckline in front and oval in the back. Classic folds shaped the bodice. The voluminous skirt billowed over many hoops. Her corsage was a lovely orchid.

There were one hundred and forty guests present.
